

### **Platform Specific Principles:**

1. Hardware dependencies should be minimal in suitably designed applications; there should be little or no impact to applications due to changes in platform strategy.
2. The underlying technology infrastructure (hardware and software) must be scalable in size, capacity, and functionality to meet changing business and technical requirements.
3. Systems must be designed, acquired, developed, or enhanced such that data and processes can be shared and integrated across the enterprise and with Connecticut's business partners.
